Introduction to Environmental Studies is a broad interdisciplinary course. Learn about the human-environmental challenges we face (climate change, biodiversity loss, pollution, inequity) and the human approaches that got us into these problems (psychology, governance, economics and more). Explore the local and global drivers of human-environmental challenges while thinking critically and creatively about personal, political, and technological solutions.

This is an online asynchronous course allowing students who are working full time or are not located in the Seattle area during summer to take this immersive and engaging course with award-winning faculty.
